

Use cases:

1. Adding Tasks

- The user requests to add task
- Website requests task name and details (and tags)
- User enters task name and details (and tags)
- User can now view the new task he has added on the return webpage

2. Editing Tasks

- Users can edit tasks that they can see on the application

3. Deleting Tasks

- Users can delete tasks that they can see on the application

4. Searching by Tags

- Users can view a list of tasks that have a certain tag

Challenges faced:

I struggled to install Rails due to version inconsistencies on my local computer, along with other issues

I am currently still going through the tutorials provided in the assignment document.
